

NATURAL GAS REFORMS

#1: Export natural gas

America is in the midst of a natural gas renaissance. Due to the sudden influx of natural gas supply, U.S. natural gas prices have dropped so low that some companies are scaling back or even shutting down production. Exports to energy-thirsty, international markets are one way to increase demand and stimulate production.

- Enable free trade of American LNG
- Streamline the LNG export terminal approval process

#2: Build infrastructure

Over 300,000 miles of natural gas pipelines crisscross America, bringing energy to our homes and industries. Still, the immense network is proving insufficient in moving our vast natural gas reserves to where they are needed.

- Prioritize interstate pipeline development to gas-constrained regions
- Establish deadlines for international pipeline permit approvals

#3: Level the playing field

Fracking is a prime example of how government research can be commercialized by the private sector. The next generation of fossil energy technologies in the development pipeline must be advanced.

- Support energy exploration efforts
- Research advanced technologies
